# CAAM 520: COMPUTATIONAL SCIENCE II HOMEWORK 1.

WEI WU

#### 1. Introduction

In this project, via finite difference method we solved a 2D Laplace equation  $-(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}) = \sin(\pi x)\sin(\pi y)$  with Dirichlet boundary conditions u(x,y) = 0. We solved the problem on a  $(N+2)\times(N+2)$  meshgrid on  $[-1,1]^2$ , with h=2/(N+1). We implemented a solver via Weighted Jacobi method for the resulting linear system. The Weighted Jacobo method is referenced from here: https://en.wikipedia.org/wiki/Jacobi\_method.

Note that by assuming zero boundary conditions, the problem is reduced to solving an  $N \times N$  system for the interior nodes.

#### 2. Testing and verification

For a small N=2 grid, we could hand compute the solution by solving the following system:

(1) 
$$\frac{3^2}{2^2} \begin{bmatrix} 4 & -1 & -1 & 0 \\ -1 & 4 & 0 & -1 \\ -1 & 0 & 4 & -1 \\ 0 & -1 & -1 & 4 \end{bmatrix} \begin{bmatrix} u_5 \\ u_6 \\ u_9 \\ u_{10} \end{bmatrix} = \begin{bmatrix} 0.75 \\ -0.75 \\ -0.75 \\ 0.75 \end{bmatrix}$$

This gives us the solution

$$\begin{bmatrix} u_5 \\ u_6 \\ u_9 \\ u_{10} \end{bmatrix} = \begin{bmatrix} 0.0556 \\ -0.0556 \\ -0.0556 \\ 0.0556 \end{bmatrix}$$

This corresponds to the solution produced by our solver. See u\_N=2.dat for the produced solution.

## 3. Results

For a residual < 1e - 6.

When N = 10, the max error is 0.001372. It takes 524 iterations and about  $7 \times 524$  many operations to converge. Wall time = 0.005255 seconds.

When N = 20, the max error is 0.000379. It takes 1818 iterations and about  $7 \times 1818$  many operations to converge. Wall time = 0.033477 seconds

When N = 30, the max error is 0.000175. It takes 3845 iterations and about  $7 \times 3845$  many operations to converge. Wall time = 0.109254 seconds

### 4. Scaling

Since I stored all of  $u, u_{true}, b$  as static arrays of doubles, it takes about  $3 \times (N+2)^2 \times 8$  bytes of memory.

For N=10, it takes 0.005255 seconds for the solver to converge. Estimated memory usage is 384 bytes.

For N = 100, it takes 9.026760 seconds for the solver to converge. Estimated memory usage is about 0.2496 Megabytes.

When I tried N = 1000, the program gave me segmentation fault. This is because the memory usage is about  $3 \times 8$  Megabytes, which is more than C's stack size. The limiting factor is hence the memory.

I then tried N=500. It takes 5009.520565 seconds with 791297 many iterations. The limiting factor is hence run time.

My conclusion is my code can run reasonably well for N equals to a couple hundreds.
